Keywords: Independent colleges; capitalization; value ability; comprehensive quality

Abstract: With the diversified development of higher education in China, many independent colleges and universities have become an important part of institutions for training highly educated talents after the completion of the transfer. The cultivation of students in independent colleges should focus on all-round cultivation of capitalized value ability elements, not only paying attention to the cultivation of correct values, but also paying attention to the comprehensive cultivation of health, practical ability, lofty ideals and social responsibilities, so as to make it more beneficial to families, society and the country.

1. Introduction

The criterion of a person's success is not just how much wealth he has acquired and how much academic qualifications he has obtained, but how much he has contributed to his family, society and country. It is more important for graduates of independent colleges to have better growth ability in the future after obtaining higher education degree. Therefore, the life value theory can be used to optimize the comprehensive quality training scheme of college students, which can not only improve the knowledge ability and employment income ability, but also highlight the long-term growth of college students and their value contribution ability to family, society and country^[1].

2. The Importance of Capitalization Ability to Enhance the Cultivation of Students in Independent Colleges

2.1. Analysis of influencing factors

People's wealth is divided into accumulated wealth and potential wealth contained in life value. Life value is the cause and effect of accumulated material wealth. We can't evaluate a person's life value according to the accumulated wealth, nor can we evaluate children's future growth ability according to the amount of family wealth^[2]. The accumulation of a family's wealth may also make students lack positive enterprising spirit. Among all the wealth created by everyone, the real value is the capitalization value of their contribution to society, that is, the part of all wealth dedicated to family, society and country.

Inappropriate remarks made by college students on some problems, it just reflects the negative influence of family wealth and social relations on children's growth in some families, these problems will inevitably lead to the lack of sustainable development of the parties. Behind these inappropriate remarks, the main reason is that college students have not paid enough attention to their ability and level of contributing to the capitalization value of family, society and country.

If just because of higher education and training qualifications, it will flaunt yourself as obviously, the successful person is neither the most important character element in the first place nor the key driving factor for realizing the lofty ideal that determines the long-term growth among the determinants of capitalization value. The cultivation of college students who pay too much attention to the promotion of academic qualifications and the effect of prestigious schools may not necessarily cultivate talents useful to families, society and the country.

2.2. Importance analysis

Life value is the most important embodiment of value in one's life, because it is the origin of all other values. Without the existence of life value, there is no material property^[3]. The wealth that a person inherits from his family is part of the capitalization value of his family members, and the capitalization value is mutual between generations. Family members all show altruistic behavior when they have the ability to give wealth, and when they are in financial difficulties, they have the demand for wealth help. So is the family, so is the society. In real society, there is little capitalization value of pure altruism, and it is impossible for people to exist independently without society.

There are many aspects of a person's life value, among which the economic part is the interaction with other people's capitalization value. At any moment, a person should benefit others, family descendants and parents, and social organizations. The sustainable development of family and society is contained in this interrelated and constantly moving relationship.

College students are the hope of a family and the backbone of social development, so this group should pay more attention to the long-term ability of capitalization value. Cultivating an excellent college student requires a lot of financial support, psychological and social support from family, society and country.

2.3. Analysis of family and social significance

In the relationship between children's education and family support, capitalization value is the economic link between two generations. Investment in education is the foundation of children's early acquisition and improvement of competitive capitalization value, so it is very important to cultivate and enhance the capitalization value ability of family members^[4].

Without effective education investment for children, children can't have a healthy body, a sound personality and the driving force of lofty ideals, and other factors can't fully play their role, which will naturally not help individuals' long-term growth, and thus the sustained growth of family wealth and long-term social progress. The accumulated wealth of the family is to provide a higher development platform for children's growth, not as a capital for showing off, let alone to lose lofty ideals and cultivate an unsound personality because wealth makes children play with things and lose their will.

College students are in adolescence, and many aspects of their thoughts are still not fully mature. According to the survey, the more superior the family living conditions are, the more outstanding this immature problem becomes^[5]. There is a Chinese folk saying: you can't be rich for three generations. This sentence reflects the crisis that family wealth lacks long-term growth. If this

vicious circle is not broken through good family and school training, then the family and society will lose the foundation of sustainable development.

3. The education and training scheme to improve the capitalization value ability

3.1. Cultivate a correct outlook on life and values

Compared with the level of education, the correctness of a person's world outlook and values is more important. Chinese traditional saying: If you are fearless, you are afraid that hooligans have culture^[6]. That is to say, if a person does not have a sound personality and correct three views, then knowledge will increase his ability to harm society.

In recent years, the scale of China's higher education has been developing rapidly, and the number of college students has increased year after year, especially the expansion of postgraduate education, which has led to a sharp increase in the number of highly educated talents. However, a phenomenon worth pondering is that many highly educated graduates fail to show what society expects of them after entering the society. What's more, many masters and doctors are "acclimatized" after entering the society.

The performance of highly educated talents in social development has become increasingly disappointing. There are more and more young people with a glass-heart, many of whom are not compatible with colleagues, are at a loss when they encounter difficulties at work, and even give up employment to "nibble at the olders" at home. The root of this series of problems lies in the lack of cultivation of college students' outlook on life and values, which leads to the "unfinished" psychological construction and can not meet the objective needs of social development.

Therefore, for the cultivation of college students, we must start with the most critical personality factors that determine the ability of capitalization value, and through effective quality cultivation, make them form a tenacious personality and diligent spirit that can overcome all difficulties, and then achieve real success that is beneficial to individuals, families, society and the country, driven by the realization of lofty ideals.

3.2. Good physical quality training

There is a Chinese saying: "The body is the capital of revolution". If a person does not have a healthy body, it is impossible for him to study effectively and work efficiently^[7]. Healthy survival time is a multiplier relationship with capitalization value level. Without this factor, the total amount of wealth creation will be insufficient.

Lack of healthy body will greatly reduce the transformation of knowledge and ability from university education to practical productivity. This will lead to the fact that college graduates can't turn all their knowledge and abilities into real wealth, and naturally they can't contribute more capitalized value to others and society. They even need to rely on social assistance or medical assistance to survive. Instead of being useful workers who contribute capitalized value to the development of family, society and country, they will become people who possess the capitalization value of others that could have been avoided.

While paying attention to the cultivation of other elements of capitalization value ability, we must put college students' health protection and physical education in an important position. We should not only pay attention to physical health, but also pay full attention to the cultivation of mental health and sound personality, so as to promote the cultivation of college students' healthier lifestyle and the overall improvement of their health literacy.

3.3. Cultivation of social practical ability

Among many factors that determine capitalization value ability, comprehensive practical ability occupies a very important position, among which training, experience, creativity and other factors are closely related to practical ability, which ultimately determines employment opportunities and salary income of college students.

In the training program of college students, to avoid the flood of theoretical teaching, we should not only integrate cases from practice into the teaching content, but also actively promote college students to participate in professional practice and social investigation extensively in winter and summer vacations, instead of relying solely on internships before graduation.

The cultivation of practical ability not only enables students to understand and absorb curriculum knowledge through practice, but also enables students to better adapt to the requirements of work ability in time, shorten the adaptation time of employment, and transform professional knowledge and skills into social productive forces as soon as possible, as well as personal income and capitalization value dedicated to family, society and country.

4. Conclusions

4.1. Strengthen the communication between school and family

The contact and interaction between family and school in the basic education stage is very close and frequent. It is precisely in this close and frequent interaction between family and school that the success of the basic education stage in China has been achieved, and parents also attach great importance to strengthening the contact with school.

At the university stage, due to geographical distance and information communication efficiency, the interaction between family and school is basically stagnant. The lack of active contact between colleges and families leads to parents' ignorance of college students' learning situation. In order to truly realize the training task at the university stage and comprehensively enhance the capitalization value ability of college students, effective communication with families should be strengthened at the stage before college students enter school and get employed.

4.2. Strengthen the connection between society and universities

The campus is in a relatively closed state, and the interpersonal relationship among college students is relatively simple. Strengthening the joint training of society and universities can enable college students to acquire professional practical skills. More importantly, it can enable college students to fully understand what kind of talents are needed by society and the competitive pressure they will face in the future social employment, so that they can pay attention to all kinds of capitalized value abilities in the process of fully understanding jobs and society.

While students fully understand the risks and challenges faced by the major, let them have a more comprehensive understanding of the future development prospects of the major and the tasks during school. They should not only send the students out, but also invite the counterpart business departments in frequently, so as to strengthen the joint training.
